

3rd Power Price Forecasting Summit

Forecasting battery revenues

András Kiss & Manuel Sánchez

05 June 2023, Milan

Agenda

- 1) KYOS and our relationship with energy prices
- 2) Battery revenue streams
- 3) KyBattery: Our inhouse model for battery valuations
- 4) Dynamic optimization with stochastic pricing
- 5) Passive imbalance trading
- 6) Forecasting long-term revenues for investment decisions and examples
- 7) Benchmarking real-life trading performance

About us

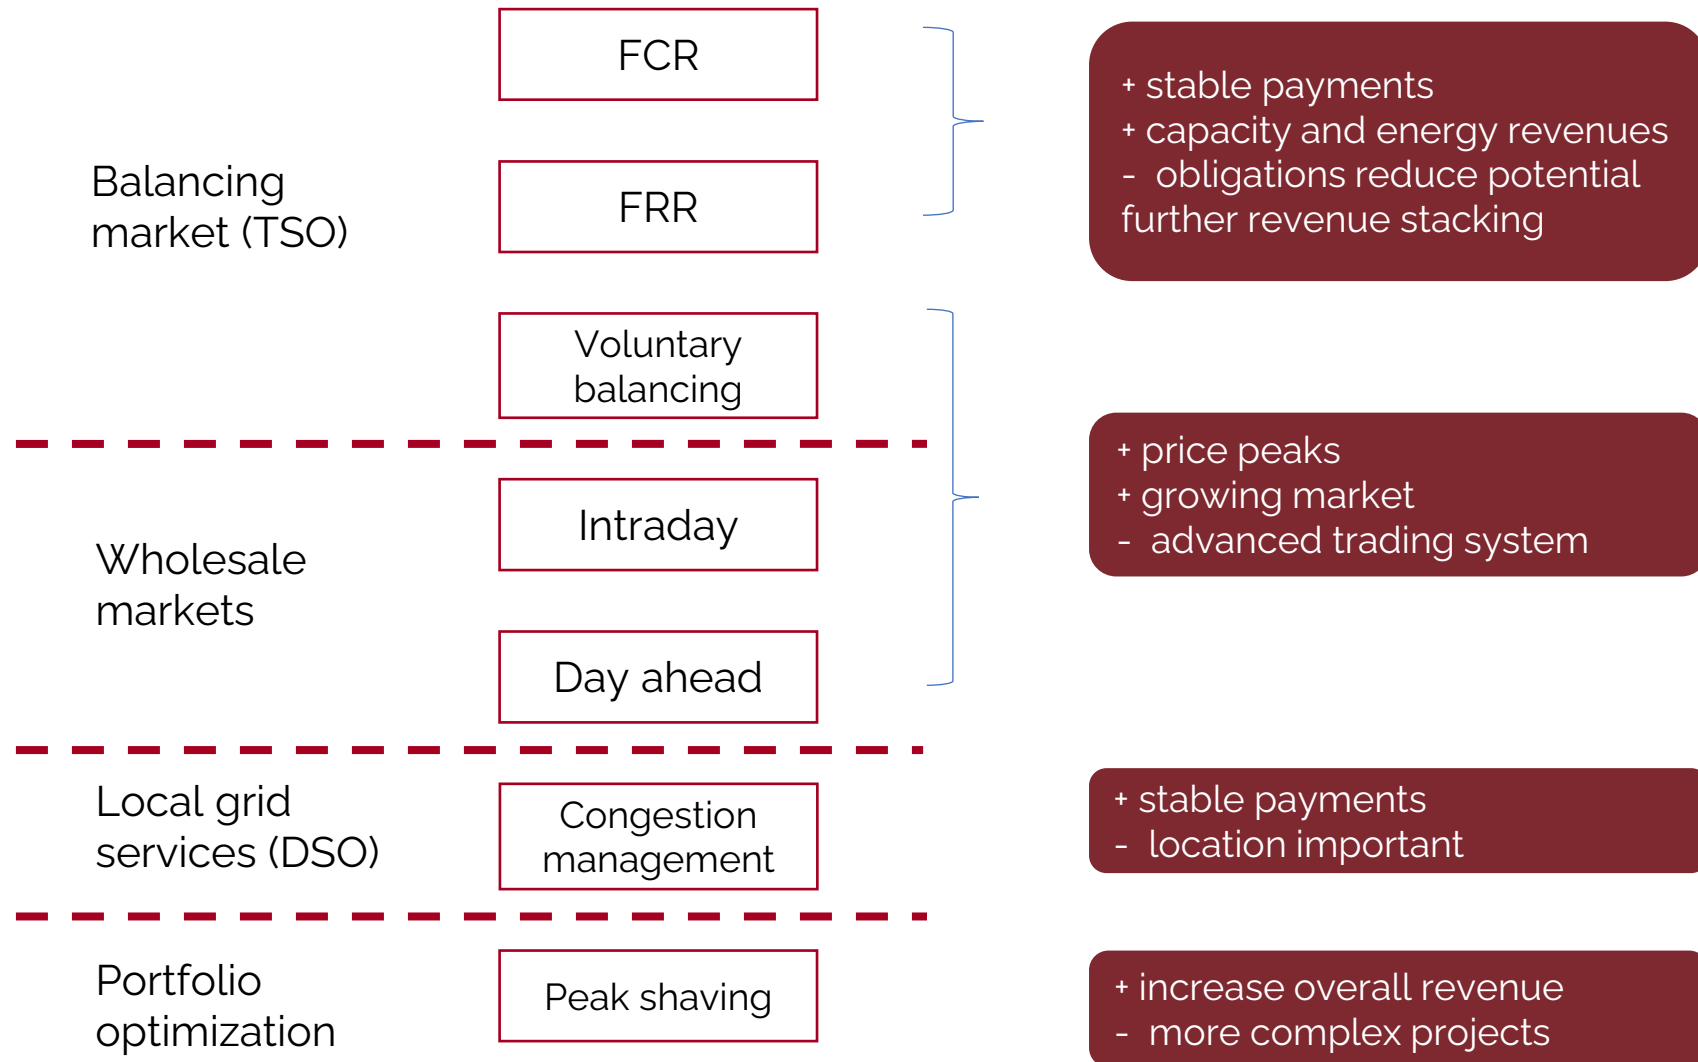

- Provide analytical support to energy companies
- Robust stochastic processes for price uncertainties
- Software to value and optimize complex energy assets with flexibility
 - Energy storage
 - Renewable PPAs
 - Natural gas storages
 - Gas swing contracts
 - LNG contracts
 - Power plants
- Delivered in **easy to use, on-line system**: the KYOS Analytical Platform

More than 100 corporate clients using KYOS software and services

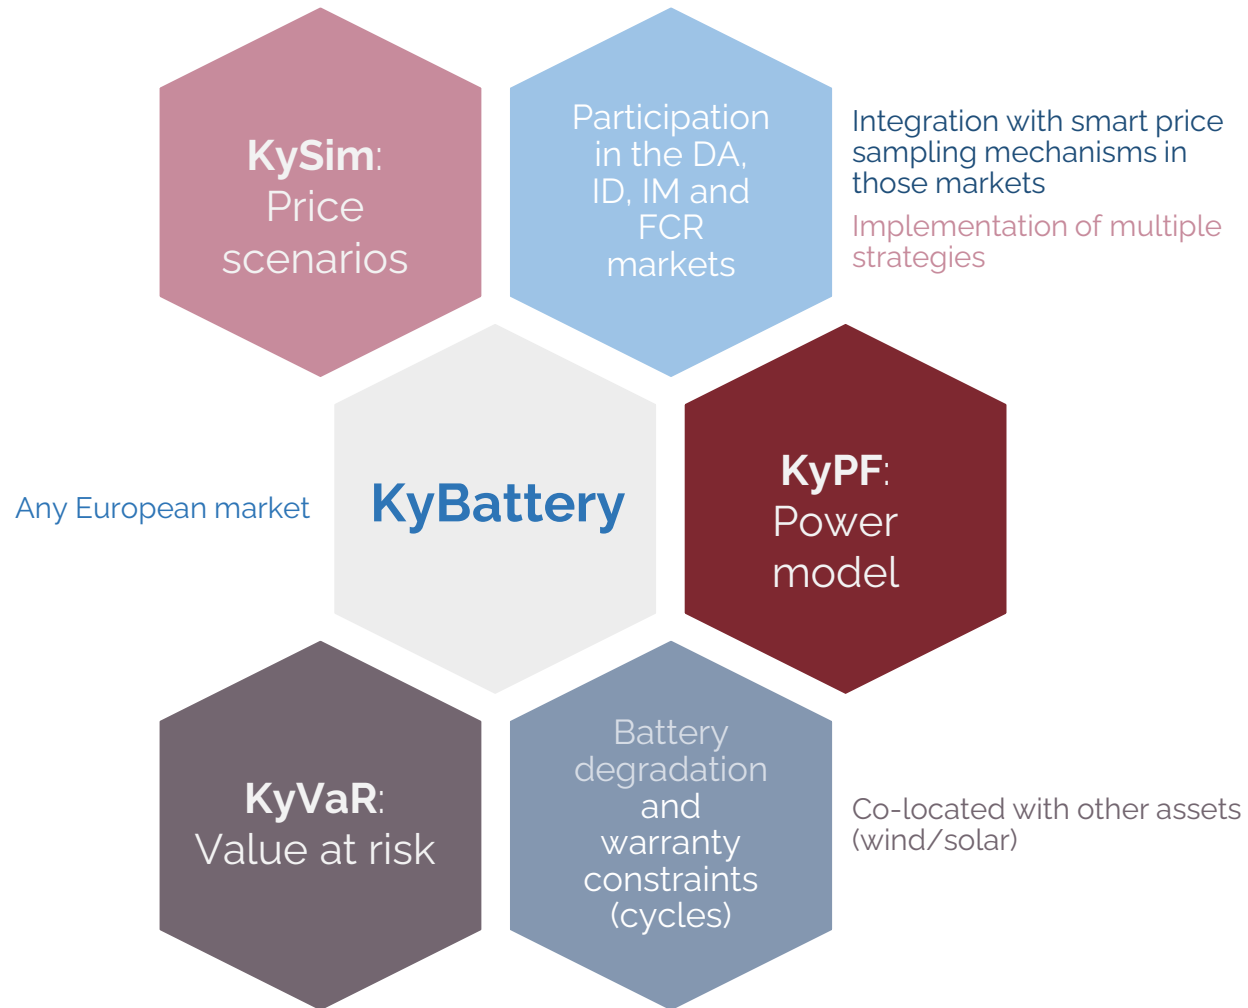

Energy storage revenue streams

Battery business case typically are a combination of revenue streams

KyBattery as a valuation model

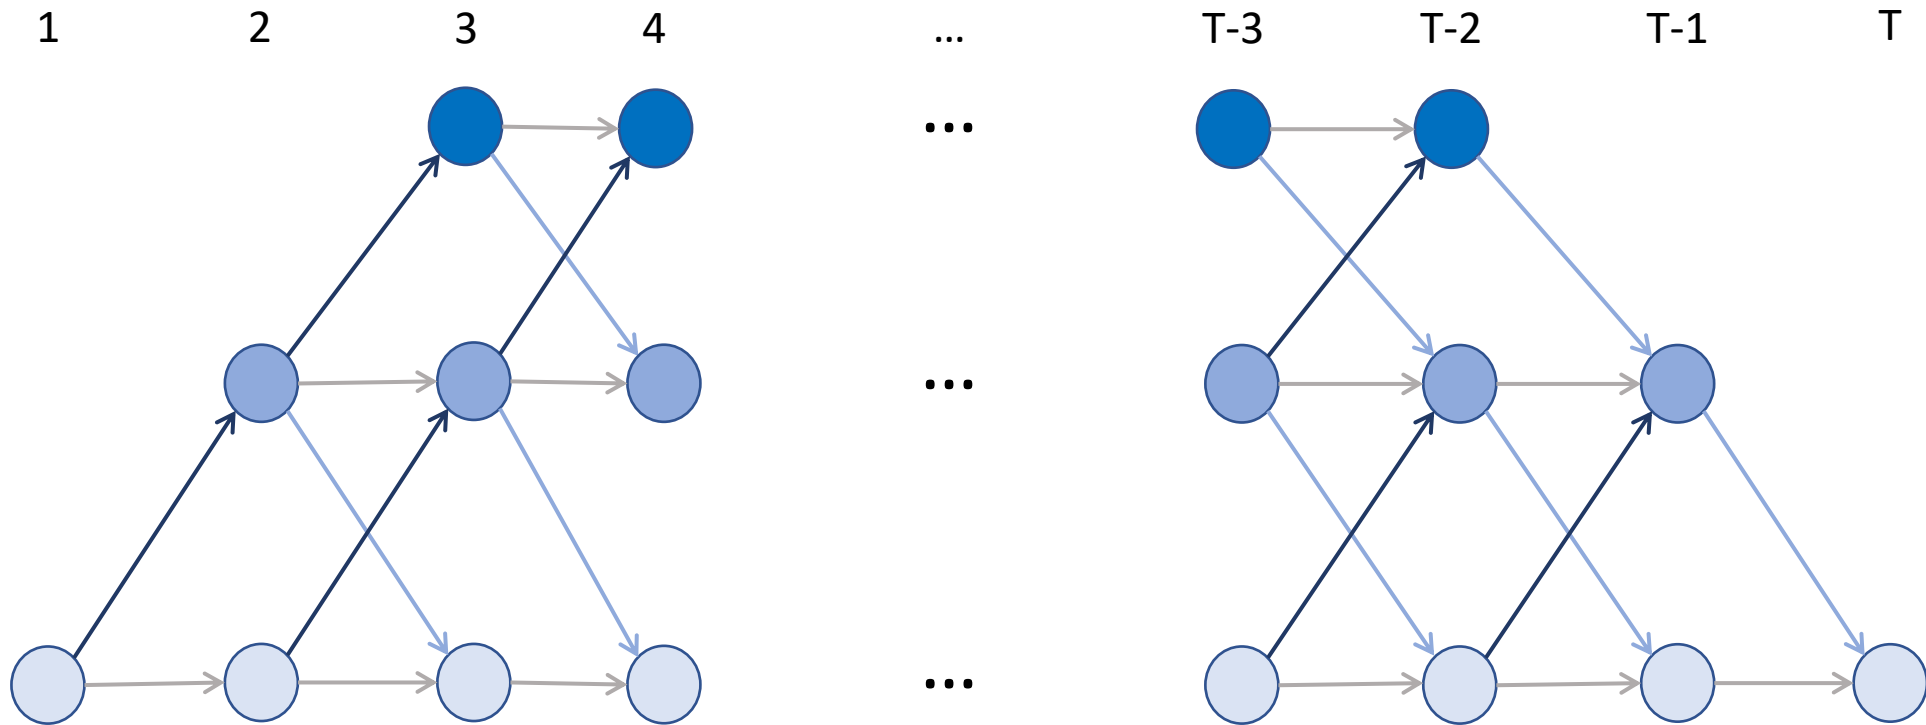

KyBattery

At KYOS we assembled a powerful tool which combines the insights from other elements of our analytical platform with the complex nature of the market pool for batteries.

Dynamic storage optimization

Stochastic prices

Least-squares Monte Carlo (LSMC) valuation

full

empty

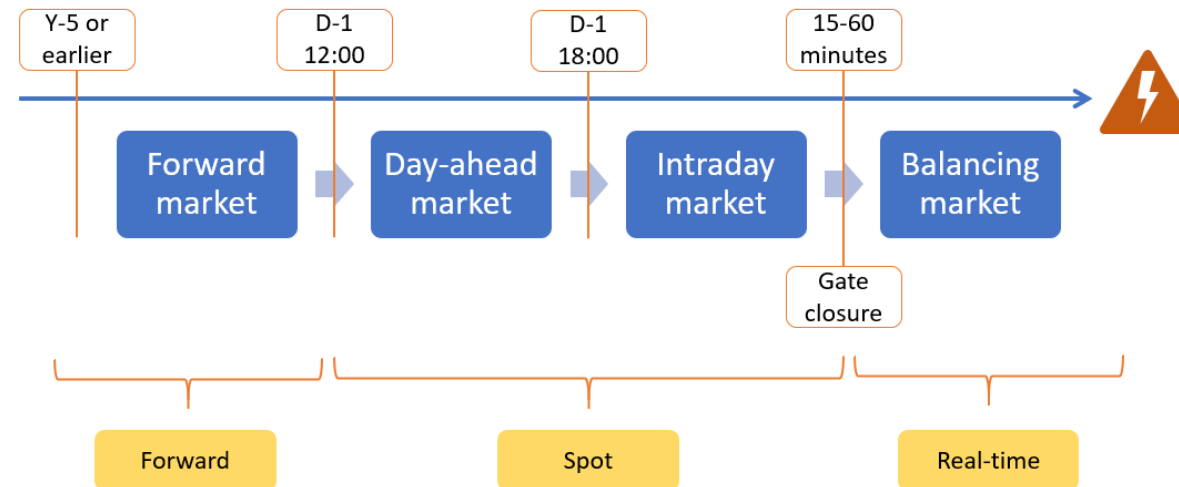

Real-time power markets

Creators of imbalances

- Balancing Responsible Parties (BRP)
- Control generation / consumption
- To match their forecast (e-program)
- If not: create imbalances

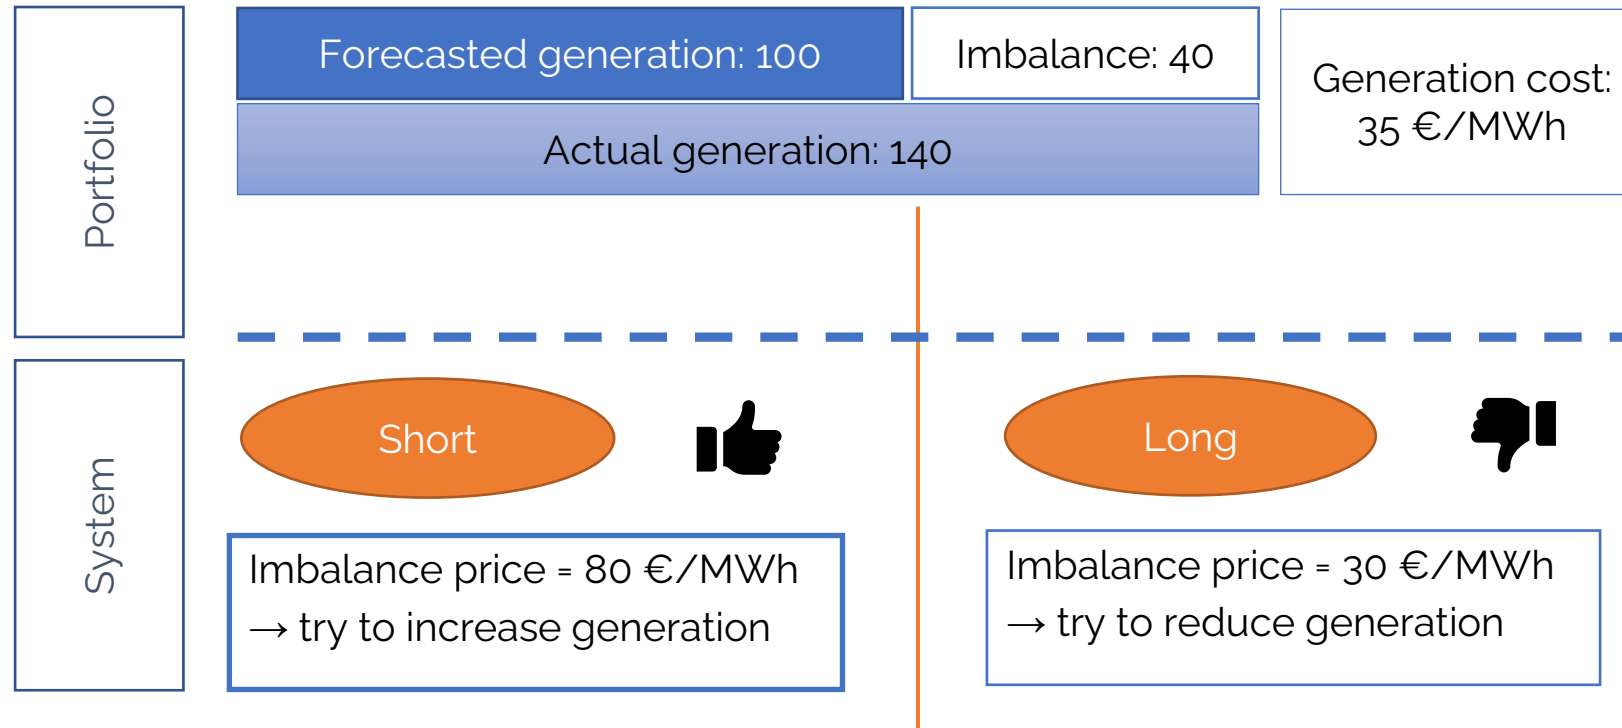

Providers of ancillary services

- Balancing Service Providers (BSP)
- Provide capacity to the TSO
- Are paid for their services
- Are activated when needed
- Resolve system imbalances

What is passive imbalance trading?

- Traditionally, BRPs have had to minimize the imbalances in their own portfolio
- TSOs increasingly accept, even encourage, BRPs to help correct the system imbalance

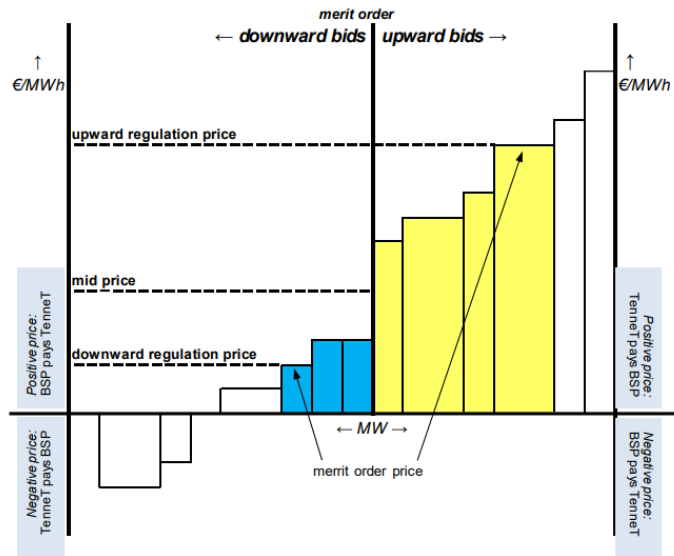

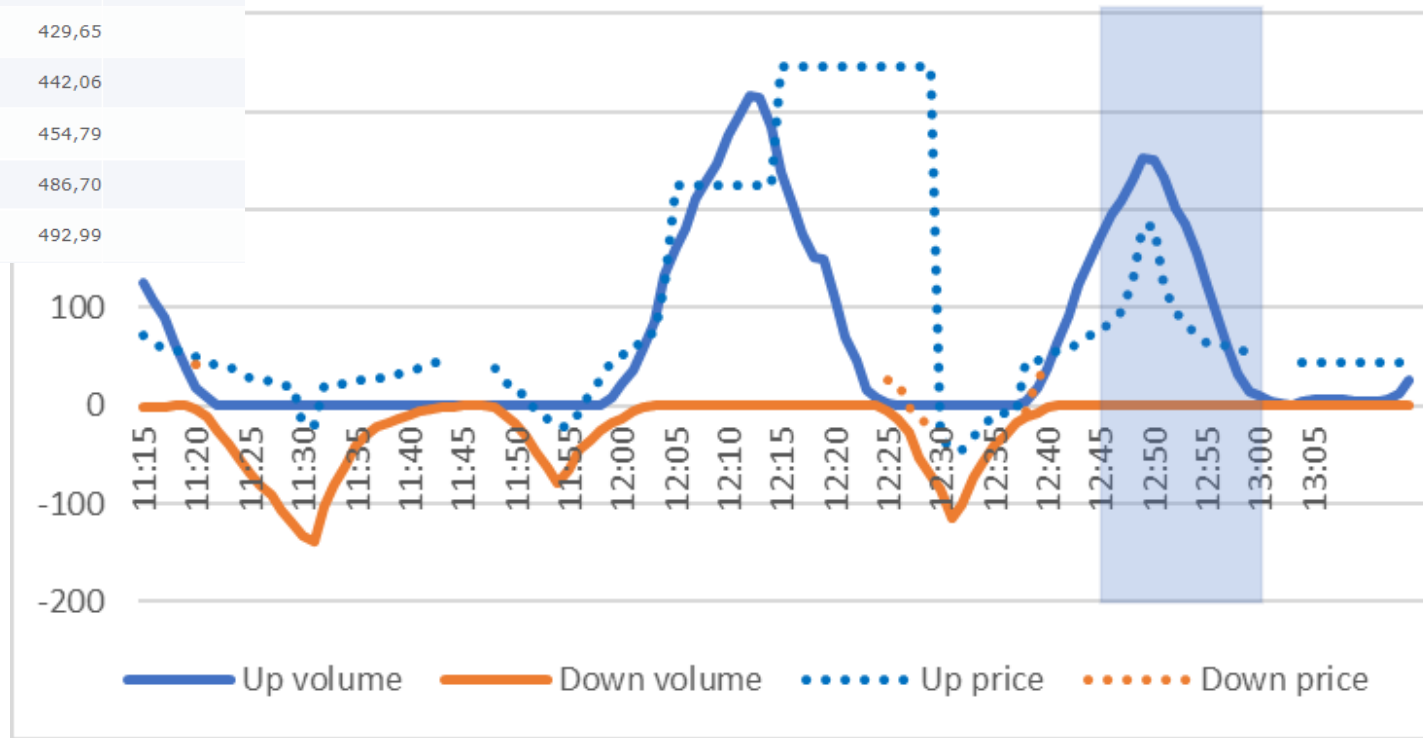

A price forecasting game with the TSO

Table	Table 2-hours	XML	Explanation	Export data
-------	---------------	-----	-------------	-------------

Time indication			Activated power					Price development	
Number	Seq. nr.	Time	Regulating		Reserve		Emerg. (0/1)	Highest price	Lowest price
			Up	Down	Up	Down	Up	Up	Down
1	526	08:45	135	0	0	0	0	349,14	
2	525	08:44	149	0	0	0	0	404,85	
3	524	08:43	160	0	0	0	0	417,26	
4	523	08:42	170	0	0	0	0	429,65	
5	522	08:41	152	0	0	0	0	442,06	
6	521	08:40	194	0	0	0	0	454,79	
7	520	08:39	203	0	0	0	0	486,70	
8	519	08:38	209	0	0	0	0	492,99

Future prices estimations

Spreads, volatilities, and uncertainties estimations

Battery cashflows projections

Battery valuations

KyBattery helps to determine battery valuations under different scenarios and market circumstances.

Revenues (€/kWh/y)	Market	Period	Day-Ahead		Intraday		Intraday + imbalance	
			Average	10%	Average	10%	Average	10%
	NL	Cal2024	45.0	35.0	71.0	65.8	117.4	108.5
BE	Cal2024	49.2	34.8	70.1	61.5	113.7	104.2	
DE	Cal2024	49.7	25.5	70.2	55.6	n/a	n/a	
ES	Cal2024	29.9	20.8	36.2	28.5	n/a	n/a	

- Battery revenues in €/kWh/y for a stand-alone located, 0.5C battery with a roundtrip efficiency of 86% and a warranty constraint of 730 cycles per year.

*We publish a free quarterly report with updates on these figures.

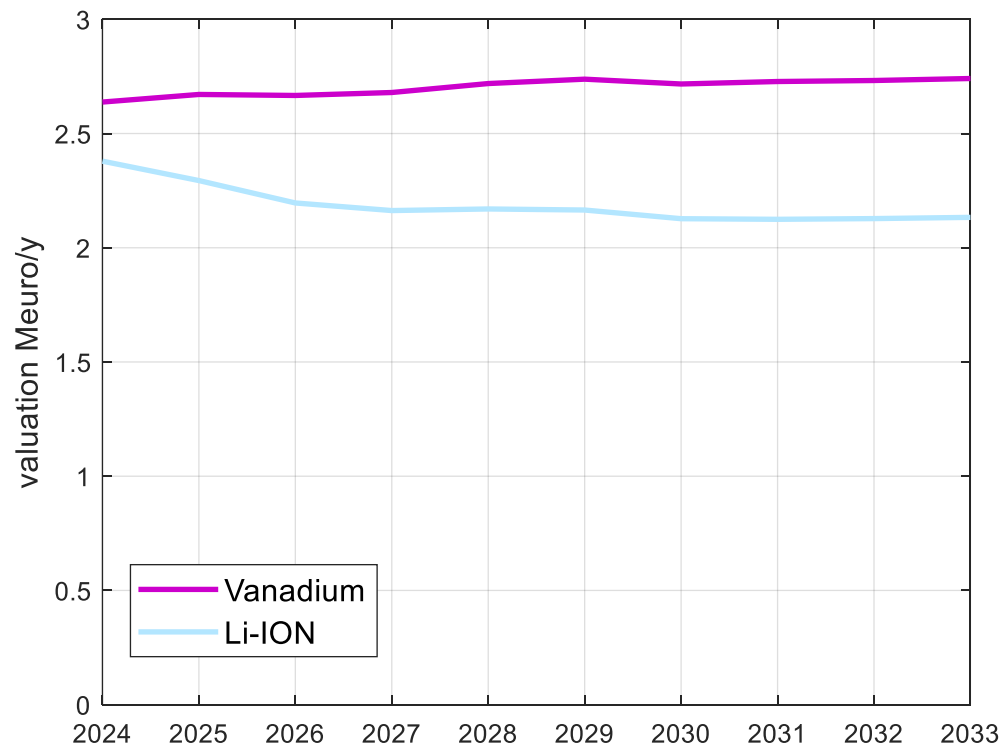

A few valuation examples

To choose between two possible batteries, for example:

- 1) A UK 10MW/2h Li-ION battery with degradation and warranty constraints (cycles/year)
- 2) A UK 10MW/2h vanadium battery without degradation or warranty constraints but with a higher capex

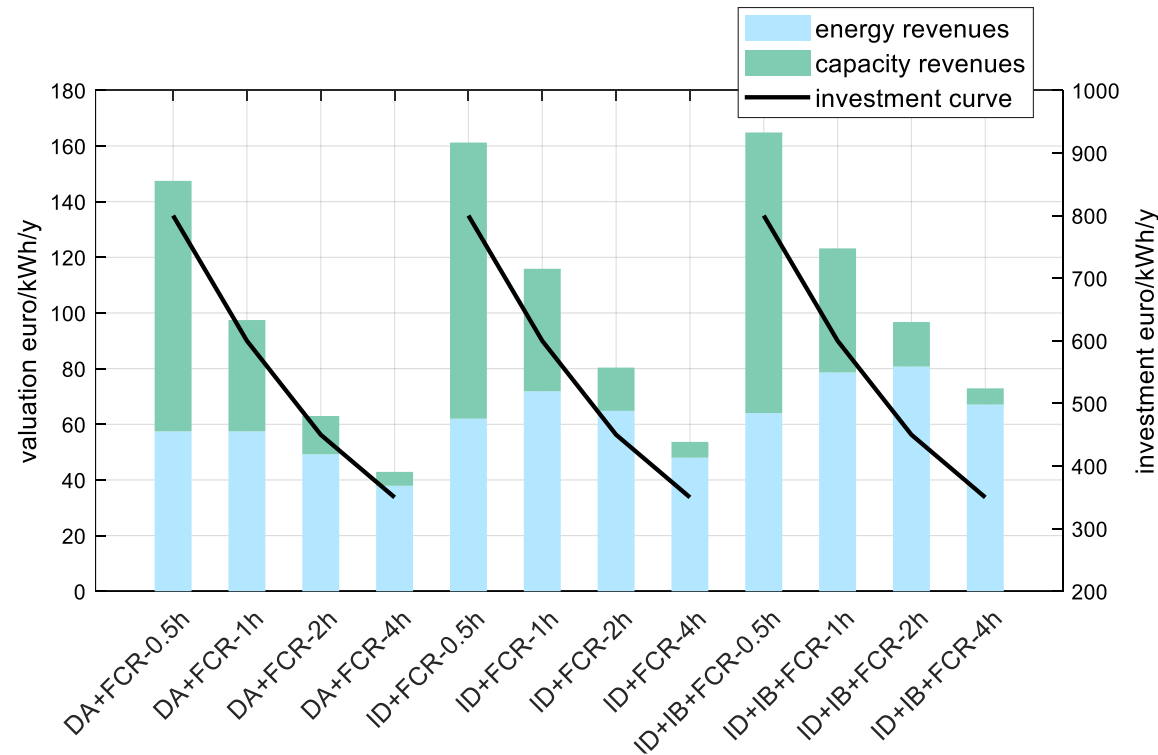

A few valuation examples

To optimize storage capacity for different markets:

Business case comparison in two axis:

- 1) Storage capacity: 30 min, 1h, 2h and 4h batteries
- 2) Market participation: day ahead, intraday, and imbalance

A few valuation examples

To value grid constraining for congestion management:

What happens with a TSO/DSO give temporary connection contracts to batteries?
